

Health Assistant — Proof of Concept

A simple AI tool that helps patients collect, organize, and present health information before medical appointments. It summarizes reports, highlights missed medications and symptoms, finds missing data, and generates clear questions to bring to the clinician.

How It Works — From Input to Action

1. Patient Input

Patients enter medicine logs, recent reports, and current symptoms (what, when, how long).

2. AI Processing

AI consolidates entries, checks medicine adherence, summarizes reports, and detects missing details.

3. Patient-Facing Outputs

Generates: clinician questions, a list of missing information, and a compliance summary to bring to the visit.

Input: Medication & Missed Doses

Patients record each medication event and any missed doses. Example entries: missed blood pressure medicine on Monday; missed diabetes medicine Wednesday evening. The system flags missed doses and timestamps them so adherence patterns are visible.

- ❑ Accurate dates and times improve the value of the summary for clinical review.

Input: Recent Reports

Patients paste or type key details from doctor visits or tests: blood test results, blood pressure readings, blood sugar logs, ECG notes, or X-ray findings. The AI summarizes the content without interpreting clinical meaning — it presents the facts clearly for discussion.

- Summarize lab/test items (e.g., "blood test uploaded: LDL, glucose values included")
- List any numeric readings provided (BP numbers, glucose values)
- Note missing or partial reports for follow-up

AI Output: Organized, Clinician-Ready

Questions to Ask the Doctor

- Are my current symptoms related to my existing condition?
- Do we need to review my recent reports together?
- What parameters should I track at home before my visit?
- What should I record (times, severity, triggers)?
- Are there follow-up tests I should schedule?

Missing Information (What to Add)

- No blood pressure readings uploaded.
- Symptom duration or severity often not specified.
- Medicine schedule incomplete (doses/times missing).
- Follow-up appointment date not recorded.
- Blood sugar logs missing for some days.

Compliance Summary

- Medication adherence: example 86% (system computes from patient entries).
- Missed doses noted: Monday and Thursday in recent log.
- Uploaded reports: blood test and blood sugar report present.
- Symptom tracking: fatigue for several days; mild headache since yesterday.

What to Bring & Next Steps

Before the appointment: collect missing readings (BP and glucose), add symptom start dates and severity, confirm medication times, and note missed doses with dates. Print or save the AI summary and questions to share with your clinician.

Quick Checklist

- Bring summarized reports (blood tests, glucose logs)
- Record 3 days of blood pressure readings if possible
- Note exact times for missed medications
- Bring list of current medicines and doses

At the Visit

- Start with the AI-generated questions
- Share the compliance summary and missed-dose log
- Ask what to track and when to follow up
